

HOW TO: Clean your corten steel modules

BEFORE

AFTER

The corten steel modules tend to leave **orange dust traces** behind as well as **staining objects** placed on and around them. In order to use the corten steel modules for inside space purpose (night/coffee table, shelf...), one might want to clean and treat them to avoid the mentioned inconveniences.

To do so, one will have to first **clean the corten** module with simple **water and soap** (Marseille soap for example). Once the surface is dry, one can start to apply one layer of **colourless anti-rust oil** (**OWATROL® OIL** is what we use). We prefer using a foam roller for application. Leave it to dry (drying time will depend of the chosen product). Once the anti-rust oil is dry, the corten steel won't produce orange stains or dust anymore.

The anti-rust oil treatment will not erase completely the visible stains on the corten steel. But, it will unify the overall colour of the module and give to it a soft shiny look.

*In summary:

Step 1:

Wash the module with water & soap.
Let it dry.

Step 2:

Apply colourless anti-rust oil.
Let it dry.
